

An emergency executive meeting at Oscorp was held after reports of serious side effects of Oscorp's new medication hit the press. Norman Osborn and Harry Osborn are extremely concerned. They suspect an employee has leaked the information to the press. Oscorp use Microsoft Office 365 and The Microsoft Azure cloud. Internally, they use Microsoft SharePoint.

Problem: Oscorp wants you to design a comprehensive "Insider Threat" program to monitor and stop employees from stealing and leaking sensitive data outside the organisation.

Assessment:

Oscorp should implement a comprehensive insider threat program focused on prevention, detection, and response using built-in Microsoft security tools. Since Oscorp relies on Microsoft Office 365, Azure, and SharePoint, the company should enforce the Principle of Least Privilege, ensuring employees only have access to sensitive data required for their job roles. Separation of Duties should also be applied to prevent any single employee from having excessive privileges that could enable data misuse. To prevent data leaks, Oscorp should implement Microsoft Purview Data Loss Prevention (DLP) policies across email, SharePoint, OneDrive, and Teams. These policies can detect and block the sharing, downloading, or external transmission of sensitive information such as medical data, proprietary research, and internal reports. Alerts should be generated when suspicious behavior occurs, such as mass file downloads or attempts to share confidential files externally. Additionally, insider threat monitoring should be enhanced using audit logging and user activity monitoring in Microsoft Azure and

Microsoft 365. This allows security teams to detect abnormal access patterns, investigate potential data exfiltration, and respond quickly to insider threats before sensitive information reaches the public.
