

Parking lot USB exercise

Contents	Some of the information found on the usb contains sensitive info like PII, that also includes an employees work schedule. This usb also includes personal files mixed in. It is not safe to store personal files with work files.
Attacker mindset	An attacker can use Jorge's personal information to use phishing attacks against him. They can also use the employees schedule to find out when they are at their desks and can easily use them for tailgating etc. If an attacker knows an employee's schedule, they can also target them with a usb attack, then downloading malicious software on their computer.
Risk analysis	A managerial control could be conducting an awareness seminar/meeting to educate workers on the importance of not inserting a foreign USB into their laptop. An operational control could be blocking any suspicious or unknown software that is trying to automatically download from a USB. A technical control can represent having an IPS that blocks any suspicious devices.
